Measuring The Oceans From Space
This book will cover the
fundamental principles of measuring oceans from space, but will contain state-of-the-art developments in data analysis and interpretation and in sensors. Completely new will be material covering advances in oceanography that have grown out of remote sensing, including some of the global applications of the data.

The Copernicus/EUMETSAT Monitoring the Oceans from Space is a complete and highly innovative course which looks at the importance of monitoring the Earth's oceans.
Welcome to the EUMETSAT course on monitoring the oceans from space. The oceans, this vast expanse of blue, are the biggest feature on our planet. They’re the reason that we call Earth “the blue planet.” They’re an important part of the Earth’s engine.
Every 10 days, Jason-1 measures heights of more than 90% of the world's ice-free oceans with the radar altimeter and completes 127 revolutions, or orbits, around the Earth. To measure sea surface height we need the satellite's position in its orbit and the height.

NASA - Ocean Topography from Space

When I stand on the edge of the ocean, or fly across the Pacific, it seems incredible that snowballs from space could have filled the oceans. Given several hundred million years, it works. Given ...
NASA has been observing the oceans from space for more than 20 years. NASA launched Seasat, the first civilian oceanographic satellite, on June 28, 1978. The satellite carried five complementary sensors designed to monitor the oceans from space. These sensors included: a
radar altimeter to measure spacecraft height above the ocean surface

Measuring Sea-Surface Temperature from Space
The surface of the ocean bulges outward and inward, mimicking the topography of the ocean floor. The
bumps, too small to be seen, can be measured by a radar altimeter aboard a satellite. Satellite imagery may also be used to map features in the water, such as coral reefs.

By subtracting the first distance (between the satellite and ocean surface) from the second distance (between the satellite and Earth's center), we can calculate the distance from the ocean surface to Earth's center.
